Labelling Basics

THE HEAT IS ON! - Direct Thermal or Thermal Transfer Labels

So, you use labels in your business every day but are you using the right ones? If you know the technology of label printing, then it helps you to choose the right label material and the right printer.

You have probably heard or used the term thermal labels, this is only half the story. We get asked all the time for thermal labels and we know that mostly we need to clarify what people really want or need. With commercial label printers, there are two main types of labels and label printing, they are Direct Thermal and Thermal Transfer. So, what are the differences?

Direct Thermal (also known as Thermal Direct) labels have a heat sensitive coating (Leuco Dye). Every printer has a thermal printhead and this provides heat according to what you want printed. When this coating is exposed to this heat it turns black and this provides the printing on the label. The only consumable is the label, so it sounds perfect doesn't it?

The one main issue is that the Leuco dye coating is not only sensitive to the printhead heat but all forms of heat. If you have ever picked up an old box that has a brown dirty looking label on it then that is the Leuco dye reacting to the ambient heat over time. One way to tell a Direct Thermal label is to rub the label quickly with your fingernail or the end of a pen and you would see a black line appear from the heat generated. So Direct Thermal labels are perfect for short term labels such as freight labels, picking labels and labels not expected to have a long life.

Thermal Transfer labels do not have a heat sensitive coating on them but instead are printed by a heat sensitive ribbon. The ribbon goes between the thermal printhead and the label material. When the printhead heats up to print it then melts the ink on the ribbon. This ink is transferred to the label material and hardens as it cools almost immediately on the label material leaving your printed image behind. So why use this type of label? Well you can print on many different materials with ribbons and the results can look as good as new for a long time. When the label material, ribbon and the printer are well matched they will produce crisp clear labels that last for many years. Many asset labels are printed this way because they are long lasting.

So how do you choose? You should consider two main factors, the lifetime of the label and also how much heat it will be exposed to. For example, if you need to heat cure paint on some cabinetry doors then direct thermal labels will probably come out completely black after that process, so you would use thermal transfer labels for this process.

Can all printers do both processes? A Thermal Transfer printer is capable of both processes however a Direct Thermal only printer can only do Direct Thermal and not Thermal Transfer.

If you need help choosing, then All About Labels can help.

Adhesives – Labels Ain't Labels

For those of you old enough to remember the old Castrol oils advert where the phrase "Oils Ain't Oils" became part of our vernacular we introduce "Labels Ain't Labels". We have spoken to many in the industry with real horror stories about their experiences with labelling of cabinetry. These experiences can be avoided just by using the right labels.

So, do some of these experiences below sound familiar to you?

- our guys spend ages picking the labels off the cabinets
- we damage the cabinet sometimes getting the labels off
- we use special solvents to get rid of the residue after we peel the label off
- we know not to leave labels on for more than two days because then we can't get them off
- we buy label sheets (at a big retailer) and they don't come off the cabinets.
- I bought a Brother/Dymo label printer because it was cheap. Now the labels costs are really hurting and I can't get them off the cabinets.

These people haven't bought the right labels.

The frustration is obvious to these people as they see it as a very small part of their overall operation but often it is the source of the most complaints from workers. When they are shown how the right label comes off the cabinets it is a revelation to them sometimes.

Do you know that if someone spends an extra 10 mins per day cleaning up after labels then that is 50mins per week or 43 hours per annum. You can easily save all this time, money and frustration. The irony is that often the right labels are cheaper to buy!!

There are several removable adhesives we can provide for all sorts of printers. We will send you a free sample of the labels for you to test apply to the cabinets.

With the right label/adhesive combination the labels can be applied to the job and then removed when required, simply and without residue.

Roll Labels

Our Labels have a premium smooth top coat that protects the print and the printhead as well as resisting moisture. The adhesive is a removable adhesive selected specifically for the cabinetry industry, so they stick but leave no residue when removed. Compatible with major nesting and labelling packages. Labels are perforated unless otherwise stated, most automatic print and apply systems prefer not perforated.

These labels listed are Direct Thermal Labels suitable for Zebra/Datamax/Honeywell/TSC/Intermec etc printers. If you need Thermal Transfer Labels then contact us for prices. For Brother and Dymo Compatible Labels see relevant page.

Brother Roll Labels

Brother and Dymo Specific Labels

The Brother consumer label printers like the QL series require special reusable label roll holders that are specific to your label size. These are supplied separately but are included in the 81916 pack. They are reusable so make sure your staff don't throw them away! The Labels are also very specific to these Brother printers. If you need labels for Dymo branded printers call for information.

Laser Sheet Labels

Whether you are in the cabinetry industry, joinery industry, a cabinet maker, a kitchen cabinet supplier, a shopfitting manufacturer then we have labels for you.

Our labels are compatible with all the popular design and nesting software solutions including CabMaster, Cabinet Vision, Pytha, EzyNest and EnRoute. Our laser sheets with a removable adhesive suit A4 laser printers. For laser label sheets the common number of labels per page are 1, 2, 4, 8, 14, 16. No more struggling getting the labels off the cabinets. Ask us for a sample today.

You can be confident in these labels. They are in daily use by hundreds of cabinet makers!

All one low price \$85.00 for 500 Sheets
